

## **Project Status Report**

### **Meeting Minutes & Updates**

We began this week by reviewing our timeline and going over the features that still need to be implemented into our website. These features included implementation of search bar and nav bar, making the user page dynamic, fetching jobs from firebase, making all data (some data is currently dummy data) real data, handling data in the network page, and implementing like, comments, share, repost, and favorite button for posts.

We determined that given we have only a month left to complete the project, certain other features will not be implemented unless time allows. This includes the mobile versions for each of our page designs, a separate “for business” page, and the messaging feature. We will create a new schedule for the remaining features that need to be implemented so that we can monitor our progress and ensure all features are on track to be completed by the deadline.

### **Individual Contributions**

**Patrick:** Led team meeting and took meeting minute notes. Created a new schedule for remaining weeks of features that still need to be implemented. Created messaging, jobs, and saved jobs page for design pages.

**Shahla:** Created the jobs page. It has 2 tabs - find jobs and saved jobs. Find Jobs tab will show the list of recommended jobs while saved jobs tab will show the list of jobs that were saved by the user. Styled it using css grid and flexbox and also made the page mobile responsive using media queries

**Sai:** Created a new profile page and network page for a take off webpage. Revised previous versions because the navigation bar or search bar should be the same in all the pages. Created page for user information like first name, last name, Date of Birth and age for the age verification. Created a pop up for a comment page.

**Daniel:** Fixed AddPost modal bugs and re-rendering issues. Implemented backend code to load all posts and its content from cloud firestore directly with a functioning like button (includes count and tracks userid that liked a post) with timestamp on each post sorted by most recent.

**Qinfeng:** Updated connections page to show other users in new connections - lists all current users in addition to existing contacts and yourself. Added Contacts feature - add an application record to firestore's connections table. Added experience and skills in profile - get the fields for this user in firestore. Updated jobs page to show jobs and execute user's saved jobs - List some

jobs in the recommended jobs page and add user's saved jobs by clicking on the job's bookmark

**Khalid:** Conducted tests on various components including Jobs, Posts, Navbars, LeftProfile, Banner, and Divider. All tested components successfully passed their respective test cases, indicating that they are functioning as expected and without errors.
